## ABSTRACT OF THE DISCLOSURE

Lattice points for correspondence defining data are determined by transmitting from a client to a server the original correspondence defining data which previously prescribes correspondence between the lattice points in the low-dimensional color space and the lattice points for ink amount for a printing apparatus, causing the server to acquire correspondence between lattice points in the lowdimensional color space and lattice points in the deviceindependent color space by referencing the original correspondence defining data, prescribing a smoothness evaluation function which evaluates smoothness of the arrangement of lattice points in the device-independent color space and has as a variable the information about the position of lattice points in the low-dimensional color space, and optimizing the arrangement of lattice points in the deviceindependent color-space by improving the rating of the smoothness evaluation function, with the information about the position of lattice points varied.
